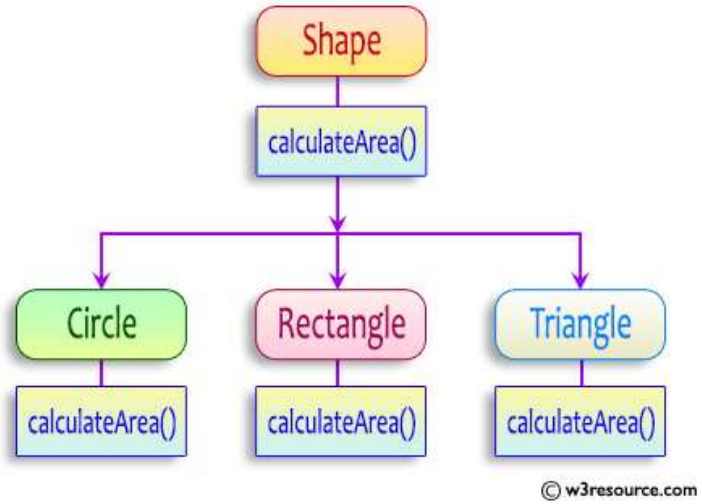
Question **1**

Correct

Marked out of 5.00

Create a base class Shape with a method called calculateArea(). Create three subclasses: Circle, Rectangle, and Triangle. Override the calculateArea() method in each subclass to calculate and return the shape's area.

In the given exercise, here is a simple diagram illustrating polymorphism implementation:



```
 abstract class Shape {
    public abstract double calculateArea() ;
    }
}
```

System.out.printf("Area of a Triangle :%.2f%n",((0.5)*base*height)); // use this statement

sample Input :

4 // radius of the circle to calculate area PI*r*r

5 // length of the rectangle

6 // breadth of the rectangle to calculate the area of a rectangle

4 // base of the triangle

3 // height of the triangle

OUTPUT:

Area of a circle :50.27
Area of a Rectangle :30.00
Area of a Triangle :6.00

For example:

Test	Input	Result
1	4 5 6 4 3	Area of a circle: 50.27 Area of a Rectangle: 30.00 Area of a Triangle: 6.00
2	7 4.5 6.5 2.4 3.6	Area of a circle: 153.94 Area of a Rectangle: 29.25 Area of a Triangle: 4.32

Answer: (penalty regime: 0 %)

```
import java.util.Scanner;
abstract class Shape {
public abstract double calculateArea();
}
class Circle extends Shape {
double radius;
Circle(double radius) {
this.radius = radius;
}
public double calculateArea() {
return Math.PI * radius * radius;
}
}
class Rectangle extends Shape {
double length, breadth;
Rectangle(double length, double breadth) {
this.length = length;
this.breadth = breadth;
```

```
}

public double calculateArea() {
return length * breadth;
}
}
class Triangle extends Shape {
double base, height;
Triangle(double base, double height) {
this.base = base;
this.height = height;
}
public double calculateArea() {
return 0.5 * base * height;
}
}
public class Main {
public static void main(String[] args) {
Scanner scanner = new Scanner(System.in);
double radius = scanner.nextDouble();
double length = scanner.nextDouble();
double breadth = scanner.nextDouble();
double base = scanner.nextDouble();
double height = scanner.nextDouble();
Circle circle = new Circle(radius);
Rectangle rectangle = new Rectangle(length, breadth);
Triangle triangle = new Triangle(base, height);
System.out.printf("Area of a circle: %.2f%n", circle.calculateArea());
System.out.printf("Area of a Rectangle: %.2f%n", rectangle.calculateArea());
System.out.printf("Area of a Triangle: %.2f%n", triangle.calculateArea());
scanner.close();
}
}
```

	Test	Input	Expected	Got	
✓	1	4 5 6 4 3	Area of a circle: 50.27 Area of a Rectangle: 30.00 Area of a Triangle: 6.00	Area of a circle: 50.27 Area of a Rectangle: 30.00 Area of a Triangle: 6.00	✓
✓	2	7 4.5 6.5 2.4 3.6	Area of a circle: 153.94 Area of a Rectangle: 29.25 Area of a Triangle: 4.32	Area of a circle: 153.94 Area of a Rectangle: 29.25 Area of a Triangle: 4.32	✓

Question **2**

Correct

Marked out of 5.00

As a logic building learner you are given the task to extract the string which has vowel as the first and last characters from the given array of Strings.

Step1: Scan through the array of Strings, extract the Strings with first and last characters as vowels; these strings should be concatenated.

Step2: Convert the concatenated string to lowercase and return it.

If none of the strings in the array has first and last character as vowel, then return no matches found

input1: an integer representing the number of elements in the array.

input2: String array.

Example 1:

input1: 3

input2: {“oreo”, “sirish”, “apple”}

output: oreoapple

Example 2:

input1: 2

input2: {“Mango”, “banana”}

output: no matches found

Explanation:

None of the strings has first and last character as vowel.

Hence the output is no matches found.

Example 3:

input1: 3

input2: {“Ate”, “Ace”, “Girl”}

output: ateace

For example:

Input	Result
3 oreo sirish apple	oreoapple
2 Mango banana	no matches found
3 Ate Ace Girl	ateace

Answer: (penalty regime: 0 %)

```
import java.util.Scanner;
public class Main {
public static void main(String[] args) {
Scanner sc = new Scanner(System.in);
int n = sc.nextInt();
String[] arr = new String[n];
for (int i = 0; i < n; i++) {
arr[i] = sc.next();
}
String vowels = "aeiouAEIOU";
String result = "";
for (String s : arr) {
if (vowels.indexOf(s.charAt(0)) != -1 && vowels.indexOf(s.charAt(s.length() - 1)) != -1)
result += s;
}

}
if (result.isEmpty()) {
System.out.println("no matches found");
} else {
System.out.println(result.toLowerCase());
}
}
```

	Input	Expected	Got	
✓	3 oreo sirish apple	oreoapple	oreoapple	✓
✓	2 Mango banana	no matches found	no matches found	✓
✓	3 Ate Ace Girl	ateace	ateace	✓

Passed all tests! ✓

Question **3**

Correct

Marked out of 5.00

1. Final Variable:

- Once a variable is declared `final`, its value cannot be changed after it is initialized.
- It must be initialized when it is declared or in the constructor if it's not initialized at declaration.
- It can be used to define constants

```
final int MAX_SPEED = 120;  // Constant value, cannot be changed
```

2. Final Method:

- A method declared `final` cannot be overridden by subclasses.
- It is used to prevent modification of the method's behavior in derived classes.

```
public final void display() {
    System.out.println("This is a final method.");
}
```

3. Final Class:

- A class declared as `final` cannot be subclassed (i.e., no other class can inherit from it).
- It is used to prevent a class from being extended and modified.
- public final class Vehicle {
  // class code
  }

Given a Java Program that contains the bug in it, your task is to clear the bug to the output.

you should delete any piece of code.

For example:

Test	Result
1	The maximum speed is: 120 km/h This is a subclass of FinalExample.

Answer: (penalty regime: 0 %)

Reset answer

```
class FinalExample {
// Final variable
final int maxSpeed = 120;
// Final method
public void displayMaxSpeed() {
System.out.println("The maximum speed is: " + maxSpeed + " km/h");
}
}
class SubClass extends FinalExample {
public void displayMaxSpeed() {
System.out.println("Cannot override a final method");
}
// You can create new methods here
public void showDetails() {
System.out.println("This is a subclass of FinalExample.");
}
}
class prog {
public static void main(String[] args) {
FinalExample obj = new FinalExample();
obj.displayMaxSpeed();
SubClass subObj = new SubClass();
subObj.showDetails();
}

}
```

	Test	Expected	Got	
✓	1	The maximum speed is: 120 km/h This is a subclass of FinalExample.	The maximum speed is: 120 km/h This is a subclass of FinalExample.	✓

Passed all tests! ✓
